QUALITY OF WATER IN DIFFERENT FISH PONDS IN HAGONNOY, BULACAN AND ITS SUITABILITY FOR MILKFISH (CHANOS CHANOS) CULTIVATION

SAN PEDRO NATIONAL HIGH NATIONAL SCHOOL
SENIOR HIGH SCHOOL DEPARTMENT

Abstract

Water quality plays a significant role on maintaining the aquatic ecosystem, agricultural productivity and the quality of fish as food. This study describes the quality of water in different fish ponds in Hagonoy, Bulacan and its suitability for Milkfish (*Chanos chanos*) cultivation through evaluating the four important water quality parameters known as pH level, temperature, salinity and dissolved oxygen. The measured values of the parameters ranges from 7.15-8.26 for pH level, 30C-35.5C for temperature, 5.6mg/L-22.6mg/L for dissolved oxygen and 14ppt-33ppt for salinity. Two out of four parameter values conformed to the suggested water quality parameter values for aquaculture set by the Department of Environment and Natural Resources Administrative Order No. 2016-08 and SNI 6148.3. On the other hand, the average value for temperature is slightly higher than the standard value while the average salinity is much lower than its suggested range.
