THE EFFECTIVENESS OF BALANGOT BRIQUETTE AS AN ALTERNATIVE FOR CONVENTIONAL WOOD CHARCOAL IN HAGONOY, BULACAN

SAN PEDRO NATIONAL HIGH NATIONAL SCHOOL
SENIOR HIGH SCHOOL DEPARTMENT

Abstract

The intention to replace portions of firewood and charcoal and thereby reduce the cutting down of forests and carbon dioxide emissions from charcoal carbonization for fuel purposes, efforts are being made to utilize biomass residues. In this regard, the researchers came up with the making of alternative briquette with alternative binder. The briquette successfully burn like the conventional wood charcoal but the burning time is not same. A table shows the comparison of conventional wood charcoal to alternative briquette based on the effectivity and the properties of Balangot (*Typha Domingensis Pers.*) plant is suitable as the main material for the production of briquettes. Based on the conclusions, the study suggested that the ratio of ingredients can still be changed as it can change the effectiveness.
